Day 25: Running Time and Complexity

 by [blondiebytes](#)[Problem](#)[Submissions](#)[Leaderboard](#)[Discussions](#)[Editorial](#)[Tutorial](#)

Objective

Today we're learning about running time! Check out the [Tutorial](#) tab for learning materials and an instructional video!

Task

A *prime* is a natural number greater than 1 that has no positive divisors other than 1 and itself. Given a number, n , determine and print whether it's prime or not.

Note: If possible, try to come up with a $O(\sqrt{n})$ primality algorithm, or see what sort of optimizations you come up with for an $O(n)$ algorithm. Be sure to check out the *Editorial* after submitting your code!

Input Format

The first line contains an integer, t , the number of test cases.

Each of the t subsequent lines contains an integer, n , to be tested for primality.

Constraints

- $0 < n < 10^6$
- $1 < k < 10^6$

Output Format

For each test case, print whether n is P or N on a new line.

Sample Input

```
3
12
5
7
```

Sample Output

```
Not prime
Prime
Prime
```

Explanation

Test Case 0: $n = 3$.
 3 is divisible by numbers other than 1 and itself (i.e.: 2 , 4 , 5), so we print N on a new line.

Test Case 1: $n = 12$.
 12 is only divisible 1 and itself, so we print P on a new line.

Test Case 2: $n = 5$.
 5 is only divisible 1 and itself, so we print P on a new line.
