

Day 21: Generics

Objective

Today we're discussing Generics; be aware that *not all languages support this construct*, so fewer languages are enabled for this challenge. Check out the [Tutorial](#) tab for learning materials and an instructional video!

Task

Write a single generic function named `printArray`; this function must take an array of generic elements as a parameter (the exception to this is C++, which takes a *vector*). The locked `Solution` class in your editor tests your function.

Note: You must use generics to solve this challenge. *Do not* write overloaded functions.

Input Format

There is no input for this challenge. The locked `Solution` class in your editor will pass two different types of arrays to your `printArray` function.

Constraints

- You must have exactly **1** function named `printArray`.

Output Format

Your `printArray` function should print each element of its generic array parameter on a new line.
